Tandem: A web-based tool for supporting students in teams (and the instructors who love them)

CoE Faculty innovators: Robin Fowler, Laura K. Alford, Stephanie Sheffield
OAI Development team: Molly Maher, Holly Derry, Ben Hayward, Ollie Saunders, Ke Yu, Kristen Miller

Opportunity/Theoretical Underpinnings

Teamwork is best taught through experience. Experiential learning requires us to close the loop through reflection; permitting/encouraging bad team habits just entrenches that learning for students.

Kolb’s Cycle of Experiential Learning (applied to teamwork)

Groups of students don’t become teams magically. Collaborative learning often has inequitable outcomes, especially for already-marginalized students.

Current Status

UM Office of Academic Innovation built it!
An OAI team of behavioral scientists, developers, usability/designers, and data scientists have taken and improved/built on the surveys and reflections we used in our first year engineering course. They have created a platform for:

Gathering information (and encouraging reflection)
• Short “team temperature” surveys
• Longer peer-feedback surveys
• Beginning-of-project survey of personality traits, teamwork preferences, and work habits
• End-of-project survey of team/project experiences

Providing formative feedback to teams
• Visualizations of team temperature surveys
• Visualizations of peer/self feedback
• Teamwork “coaching,” tailored based on initial, team temperature, and peer feedback surveys (tailored both by topic—some teams will see particular lessons and others won’t—and by content. Tandem uses the Michigan Tailoring System to adjust messaging for individuals based on algorithms we pre-specify

Encouraging reflection on teamwork experiences
• Visualizations to enable students to compare their own assessment of team performance to others’
• Reflection prompts encouraging students to consider how their teamwork behaviors have met their own goals, or how they can improve to do so in the future
• Reflection prompts on each lesson to encourage students to apply teamwork lessons to their own context

Semester begins
This example class has weekly check-ins and lessons; two major peer evals.

Each loop = 1 week

Surveys

Beginning-of-term survey:
• Personality, group/team preferences, work preferences, self-efficacy, belonging, academic motivation, housing, schedule

Team temp survey:
• Quick (5 items): Working well, sharing workload equally, sharing ideas, logistics, confidence

Peer feedback survey:
• For self and others, rating contributions, reliability, ease of working with. Questions intended to assess overall inequity of workload (social loafing) as well as group communication (balance, voice safety), task allocation (making sure students divide up work equitably; all students share ‘desirable’ and ‘undesirable’ tasks)

Teamwork lessons

Short lessons on teamwork and teamwork-adjacent topics, framed by behavioral scientists to encourage positive behavior changes

Ex topics: Imposter syndrome, trust on teams, giving & receiving feedback. All topics include reflections
Tailored based on

Visualizations

Weekly team-level visualizations based on team checks; shows aggregate team score only, over time. Tailored based on

“Meet your team” visualizations, tailored based on

“Reflect on your team performance” visualizations/lesson/reflection, based on

Semester ends

Faculty view helps us understand how teams are doing

Student view shows them aggregate info from their own team

Future Plans

In the works
• Continue to pilot/revise existing content
• Make available to more courses at UM and beyond
  • Winter 2019: Engr100-600
  • Fall 2019: Engr 100-600, Phys140, Taubman Architecture Graduate Studio
  • Winter 2020: ??? Contact Molly Maher (mmarymo@umich.edu) if you are interested!

For the future
• Add a team formation tool
• Add element(s) of natural language processing and/or group communication analysis, so that open-ended student input can be used to tailor content
• Integrate with other tools (Canvas, GoogleDocs, a chat platform) to optimize user experiences and to allow additional teamwork metrics
• Integrate machine learning so that the tool can evaluate relationships not pre-specified by researchers; Use the platform to test efficacy of various interventions for improving team experiences
